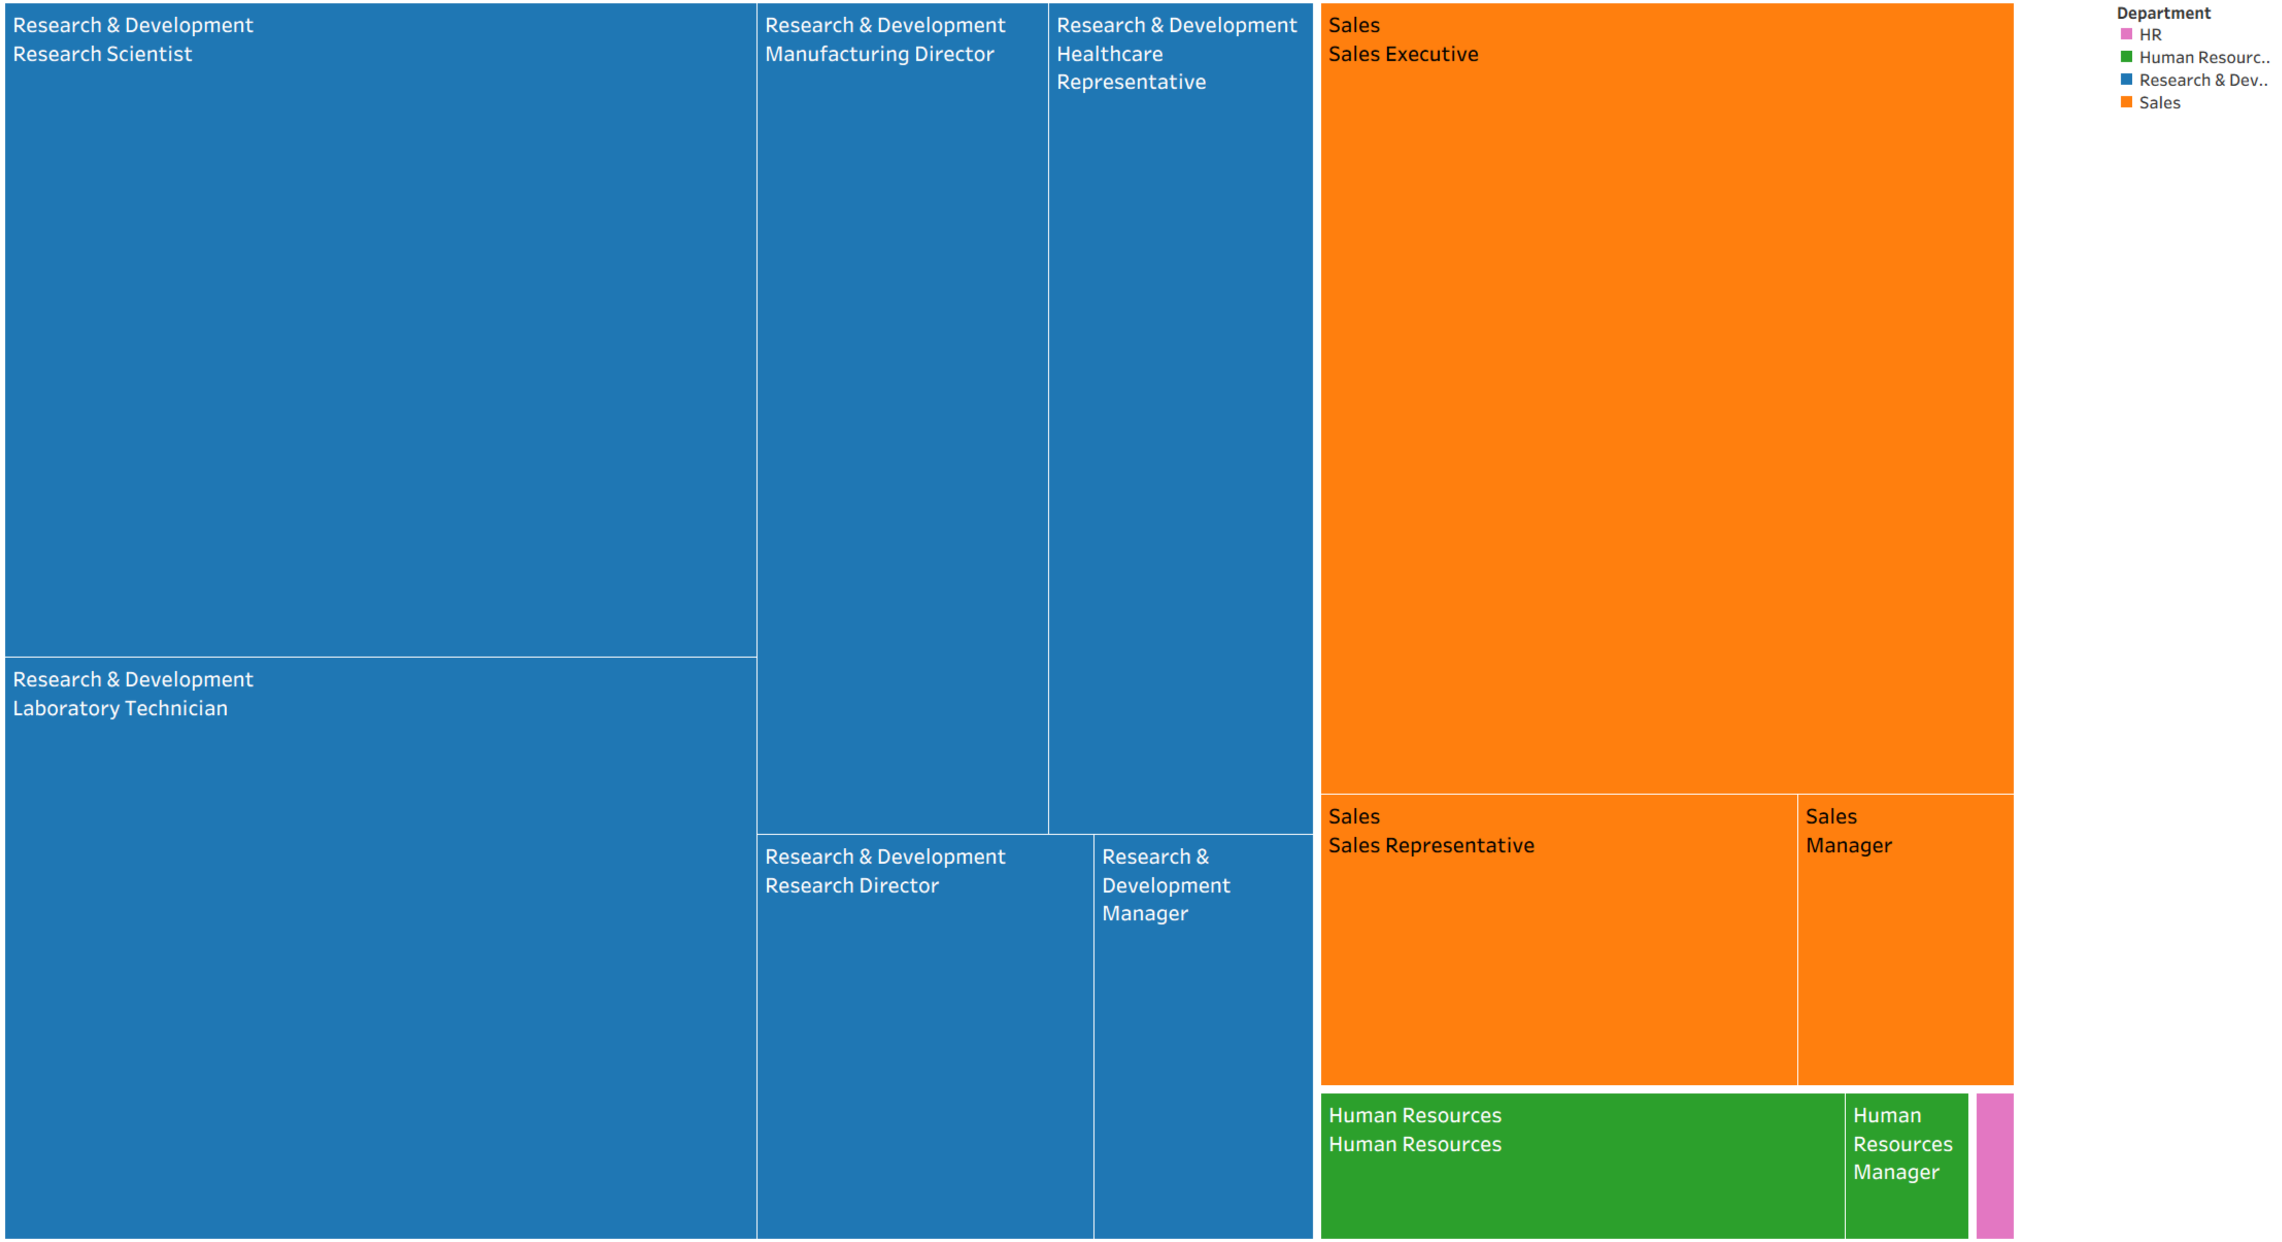
ITAO7102: Human Resources Analytics

Jai Tajvir Baloda - 40485958

Story

The organization is primarily structured around three core departments: Research & Development, Sales, and Human Resources. The Research & Development sector represents our largest talent pool, followed by a substantial Sales division, which together form the operational backbone of the company.

Our workforce profile reveals a mature and stable demogr..

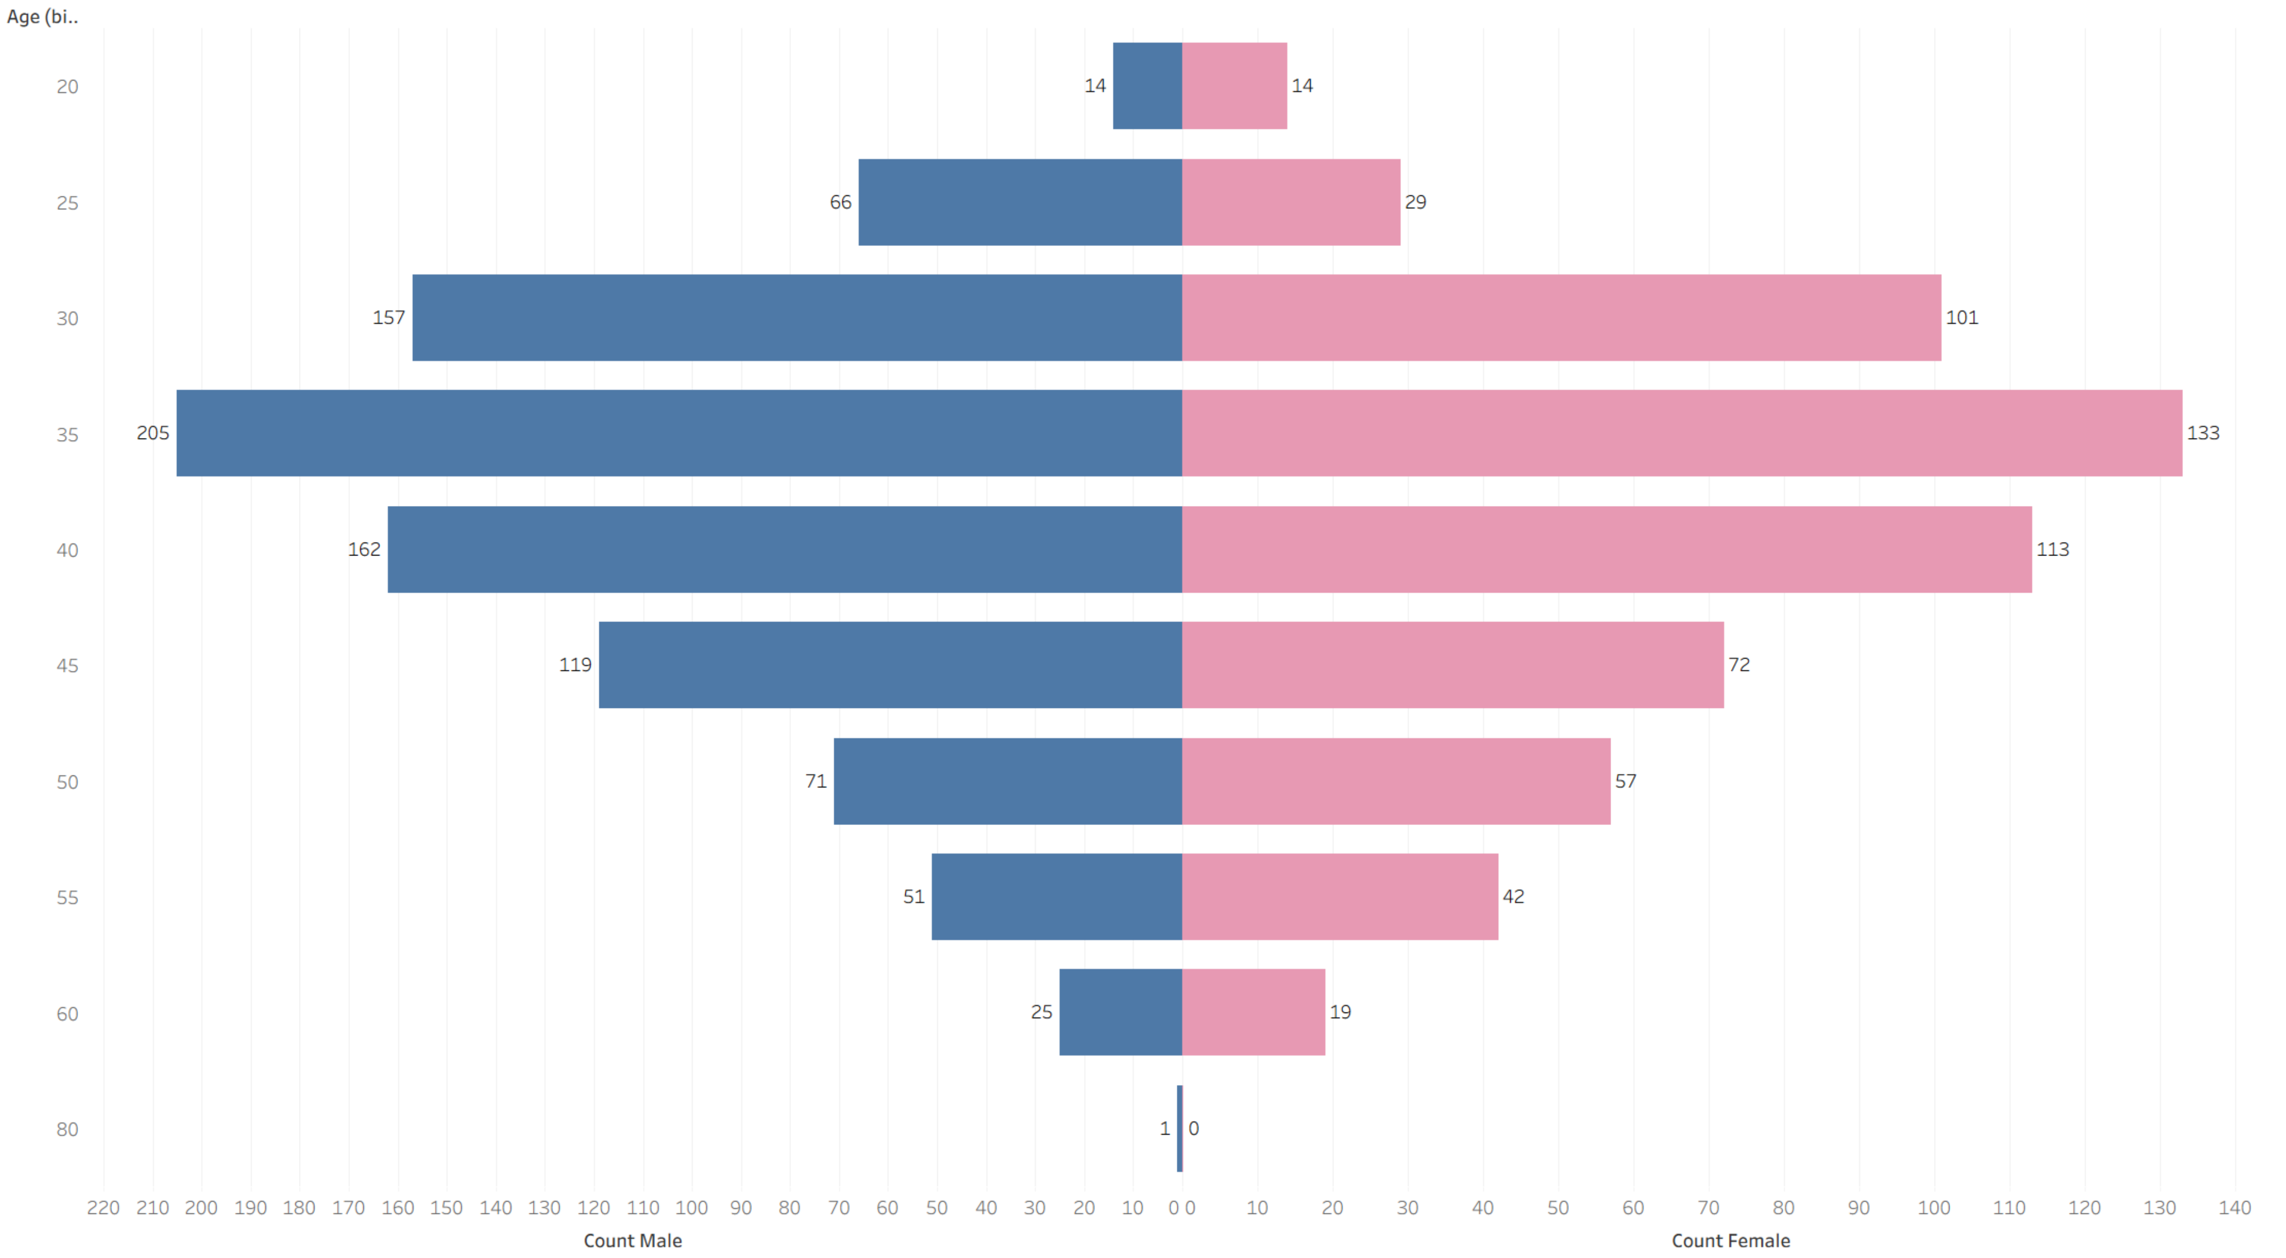


Story

The organiza tion..

Our workforce profile reveals a mature and stable demographic, with the highest concentration of employees falling within the 30–40 age bracket. While the gender distribution is relatively balanced, this data serves as the baseline to identify where future turnover imbalances might emerge.

Our analysis reveals a criti..



Story

Our workforce p..

Our analysis reveals a critical talent crisis localized in the Sales department, where attrition is nearing 40%. If no action is taken, the organization faces a 'recruitment death spiral' and a significant loss in market share as veteran sales expertise exits. Leadership must now decide on a targeted retention plan for these specific high-risk roles to stabilize the revenue pipeline.

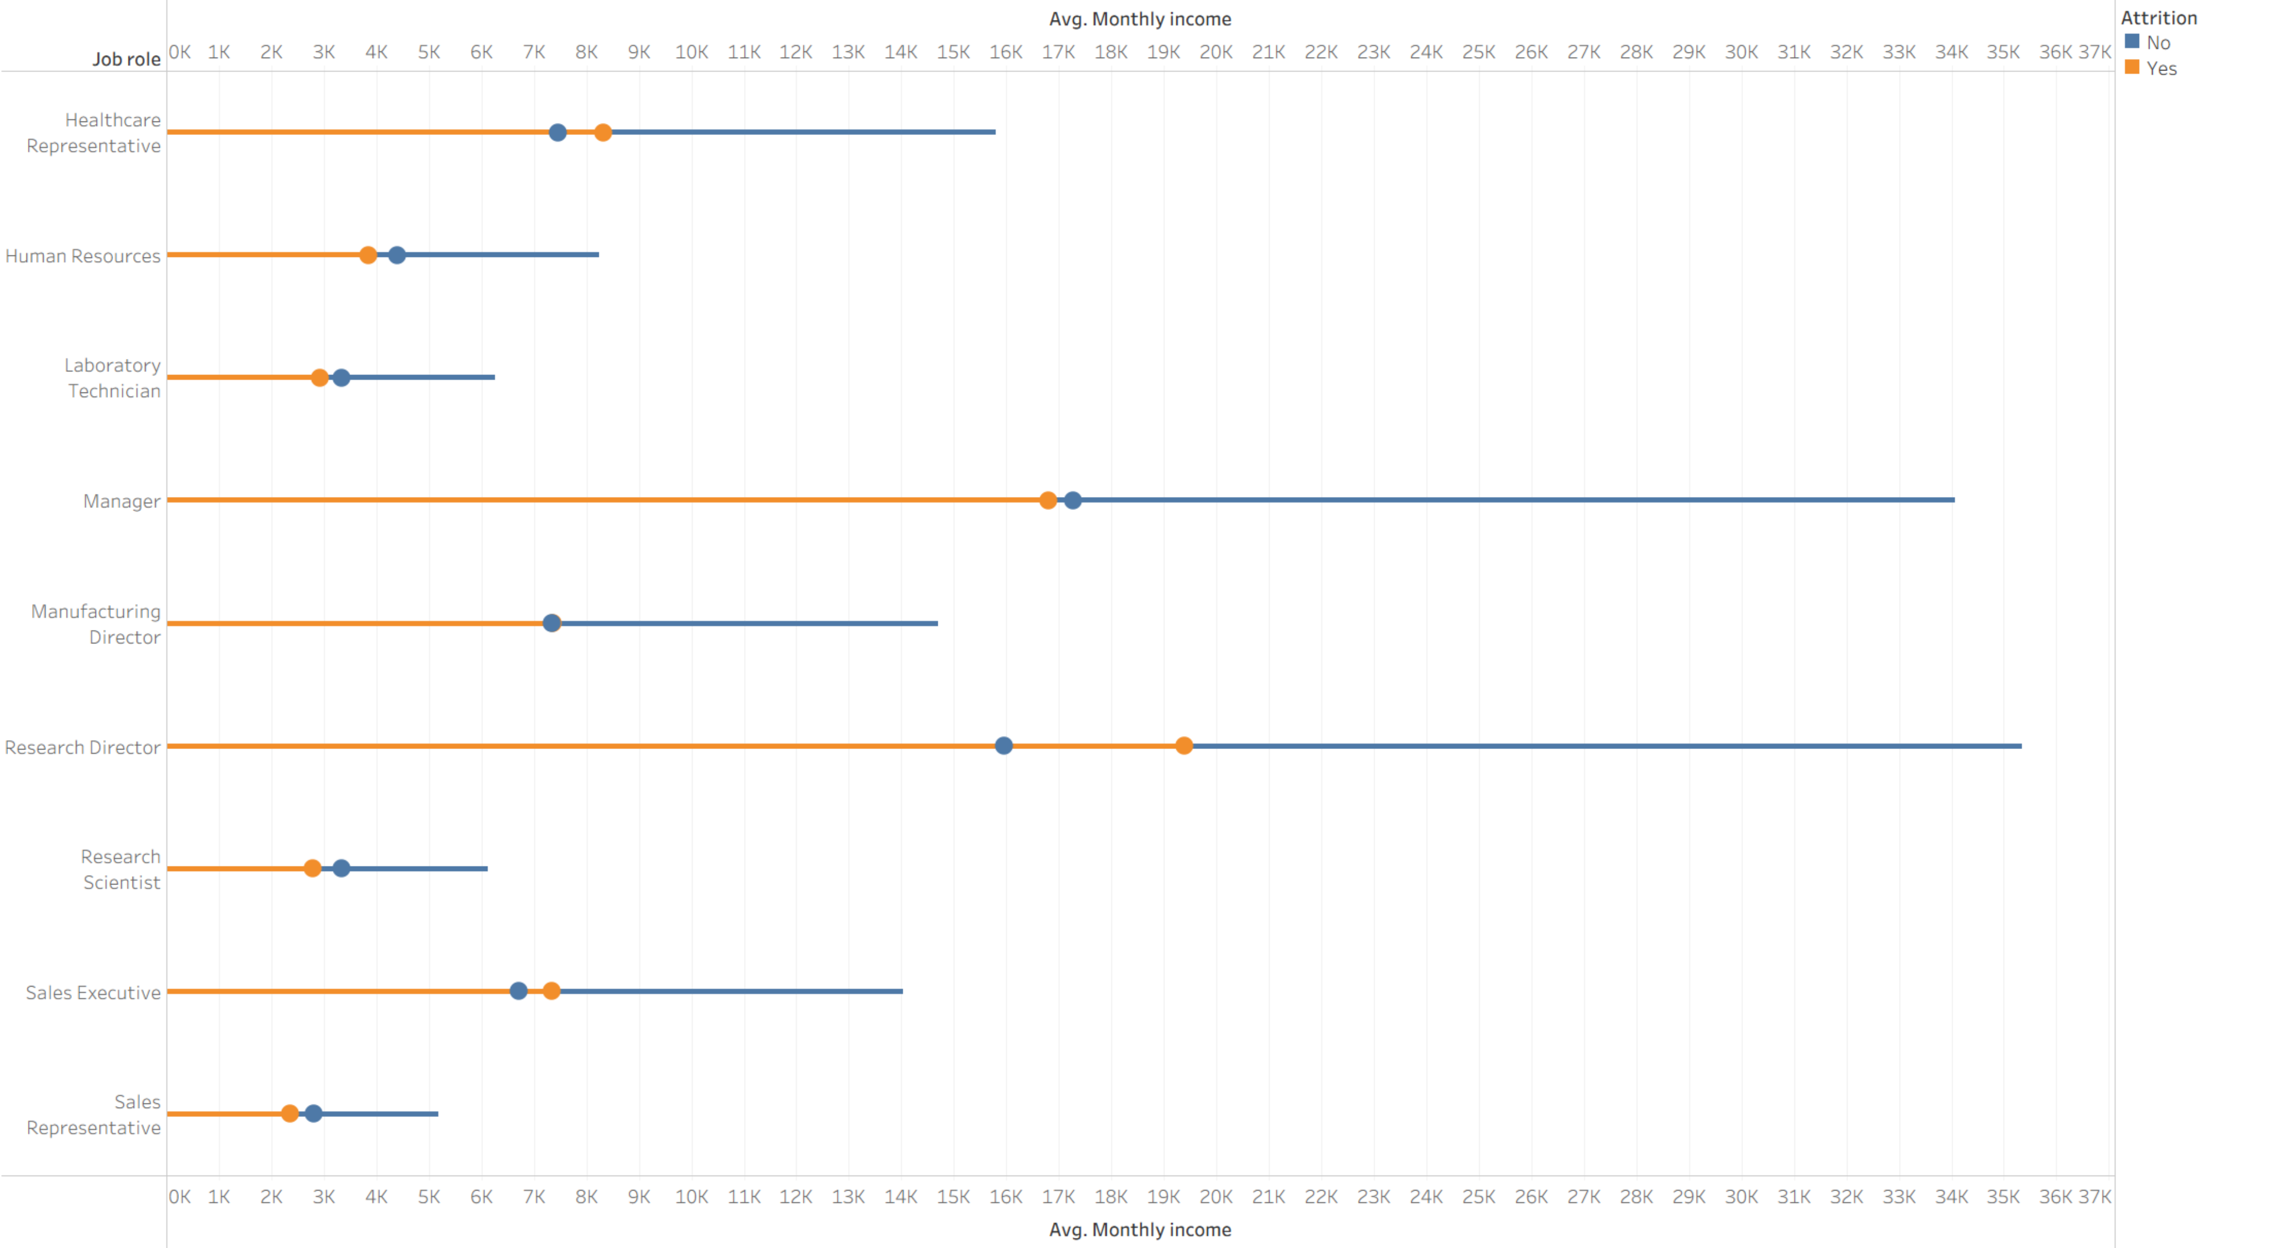
The tension is compounded ..

Story

Our analysis reveals a cri..

The tension is compounded by a financial misalignment, as leavers are consistently paid significantly less than their retained counterparts. If no action is taken, the organization will continue to serve as a ‘training ground’ for competitors who offer market-aligned salaries. The board must decide on a strategic budget reallocation to close this compensation gap and secure our human capital

Systemic burnout is th..

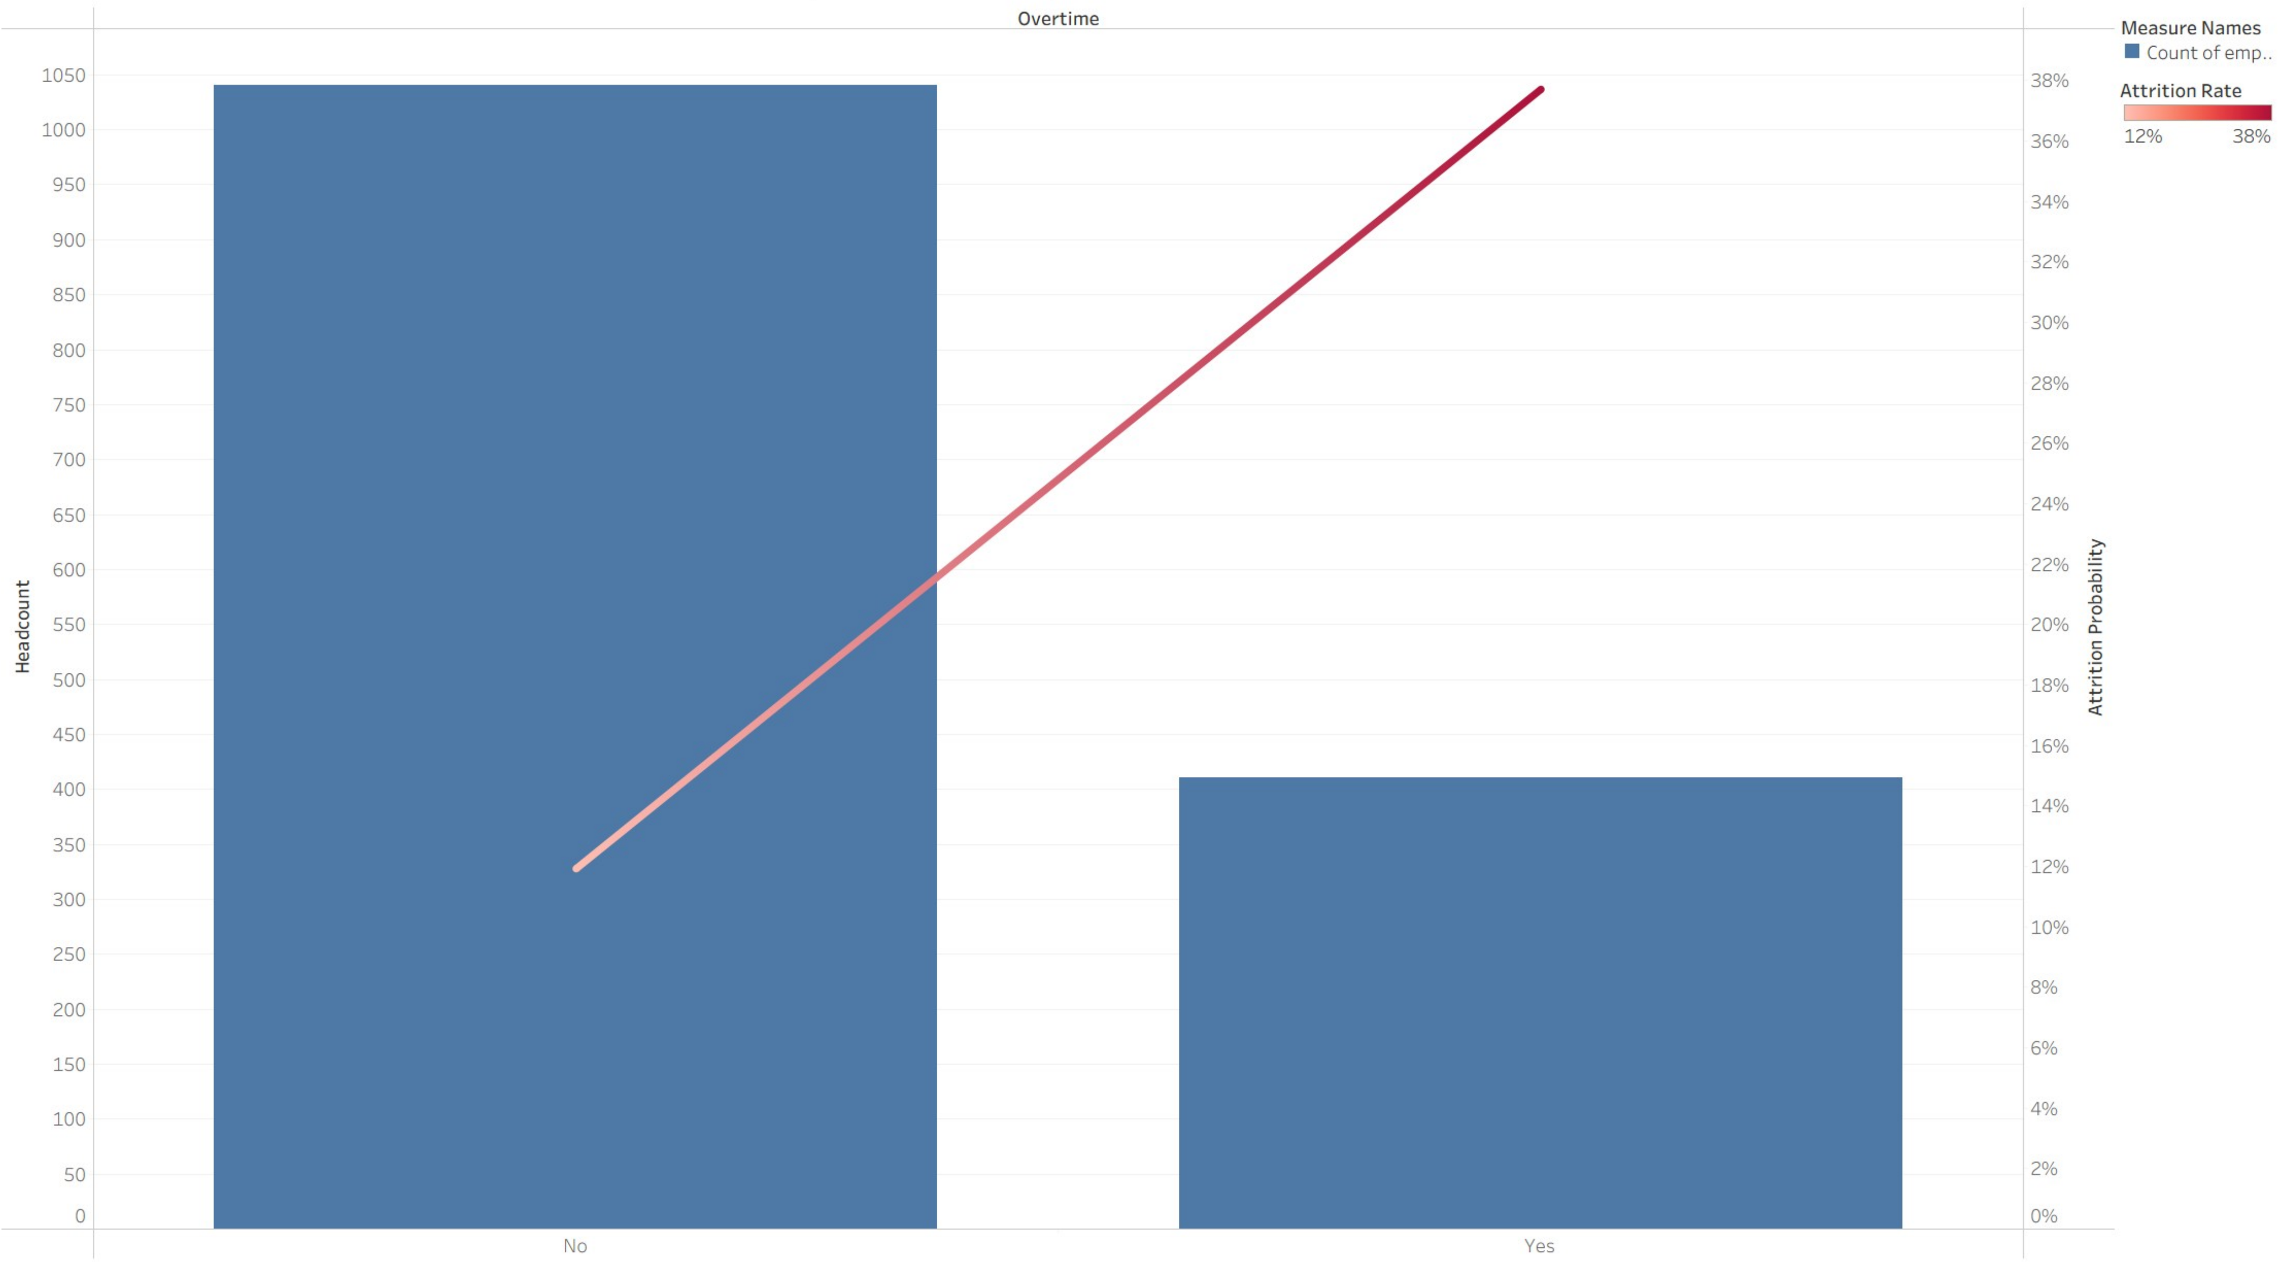


Story

The tension is compoun..

Systemic burnout is the primary driver of this conflict; employees working overtime are leaving at double the rate of their peers. If no action is taken, we risk a total operational collapse in R&D and Sales as the remaining staff become overwhelmed by the vacancies. A critical decision is required to implement immediate overtime thresholds and adjust headcount planning to protect employee well-being.

Geographic tension is evi..

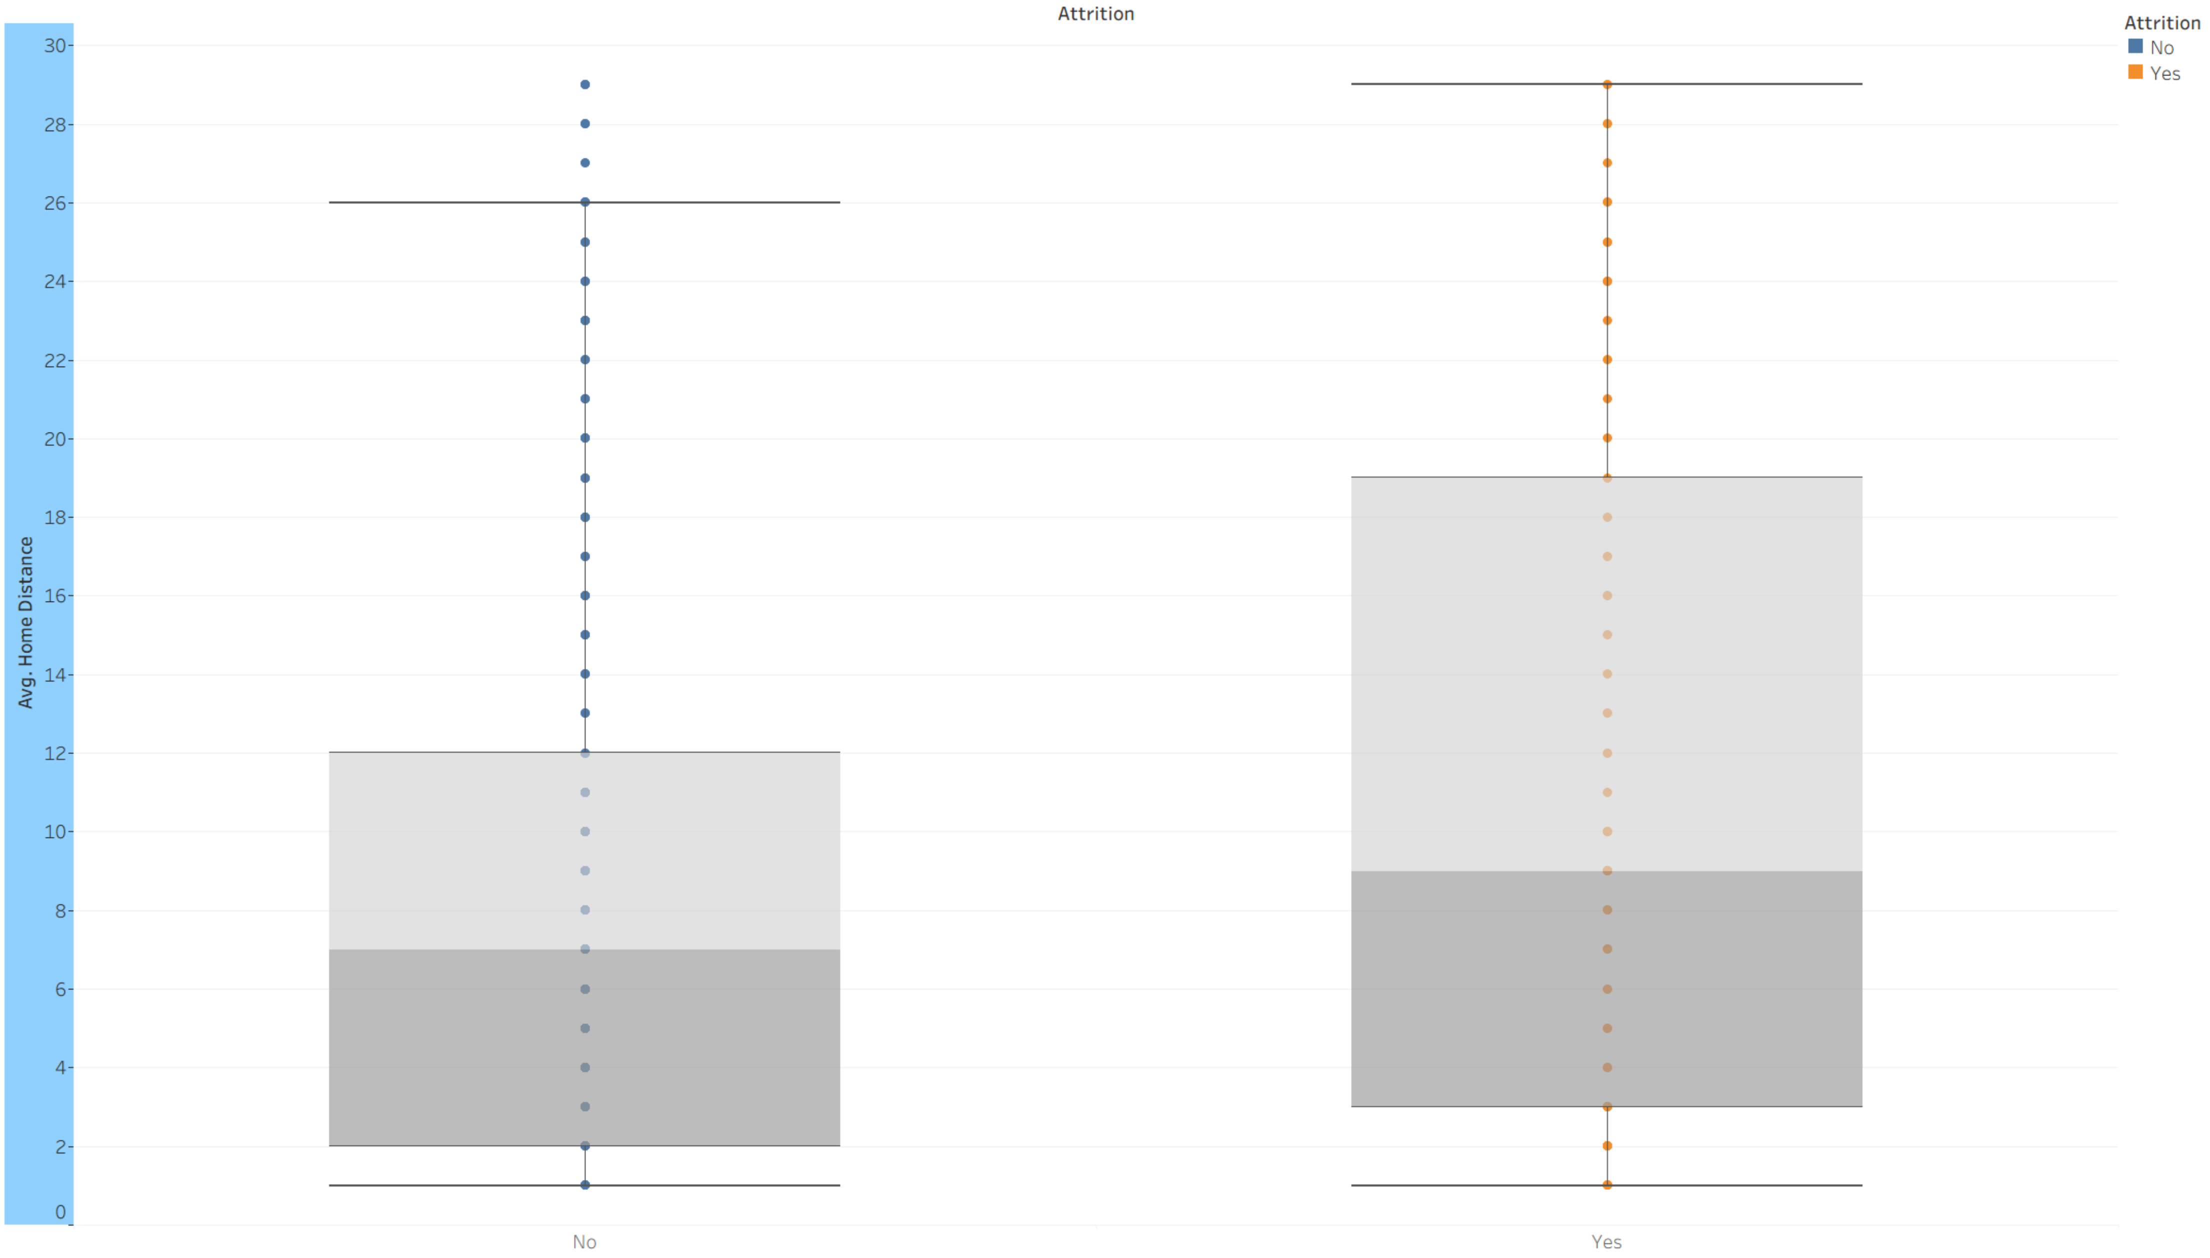


Story

Systemic burnout is t..

Geographic tension is evident: leavers live 25% further away on average. Without action, we face continued talent loss and rising recruitment costs due to unsustainable commutes. Management must decide between implementing hybrid work options or providing travel subsidies

Data highlights a s..

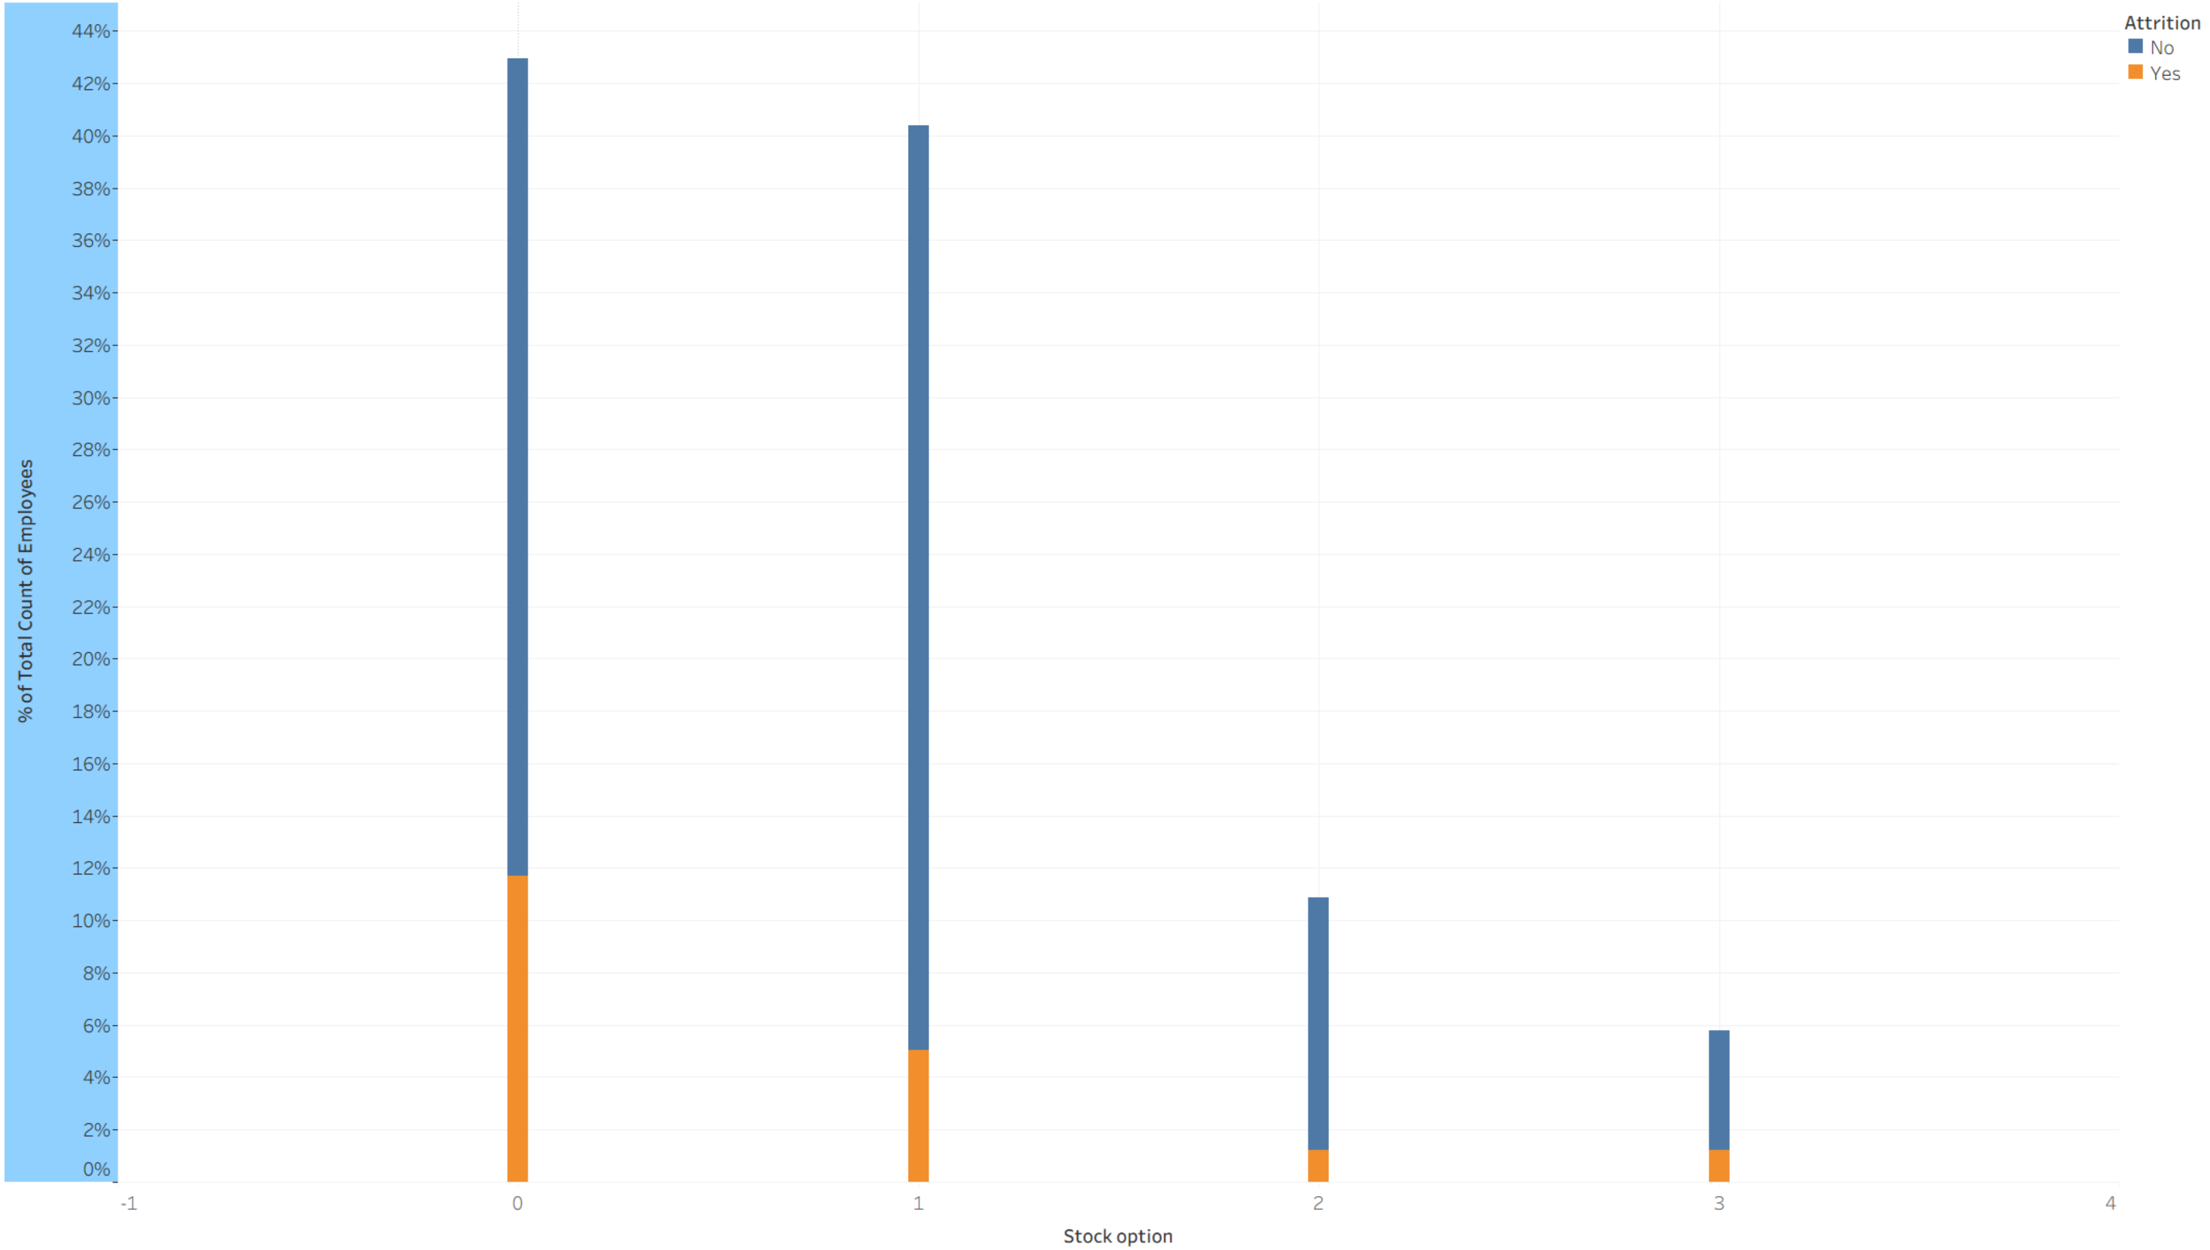


Story

Geographic tension is e..

Data highlights a stark financial tension: attrition is nearly three times higher among employees with zero stock options compared to those with equity stakes. If no action is taken, our compensation package will remain uncompetitive for top talent who seek long-term wealth creation. The Board must decide whether to expand stock option eligibility to junior Sales and R&D roles or risk losing them to competitors with better equity incentives.

To resolve the identified ten..



Story

Data highlights a..

To resolve the identified tension, we recommend that HR and Department Managers prioritize immediate retention interventions for our high-performing but dissatisfied Sales Representatives. By focusing on this specific 'at-risk' group of top talent, we can prevent the loss of our most valuable revenue-driving employees before they decide to leave.

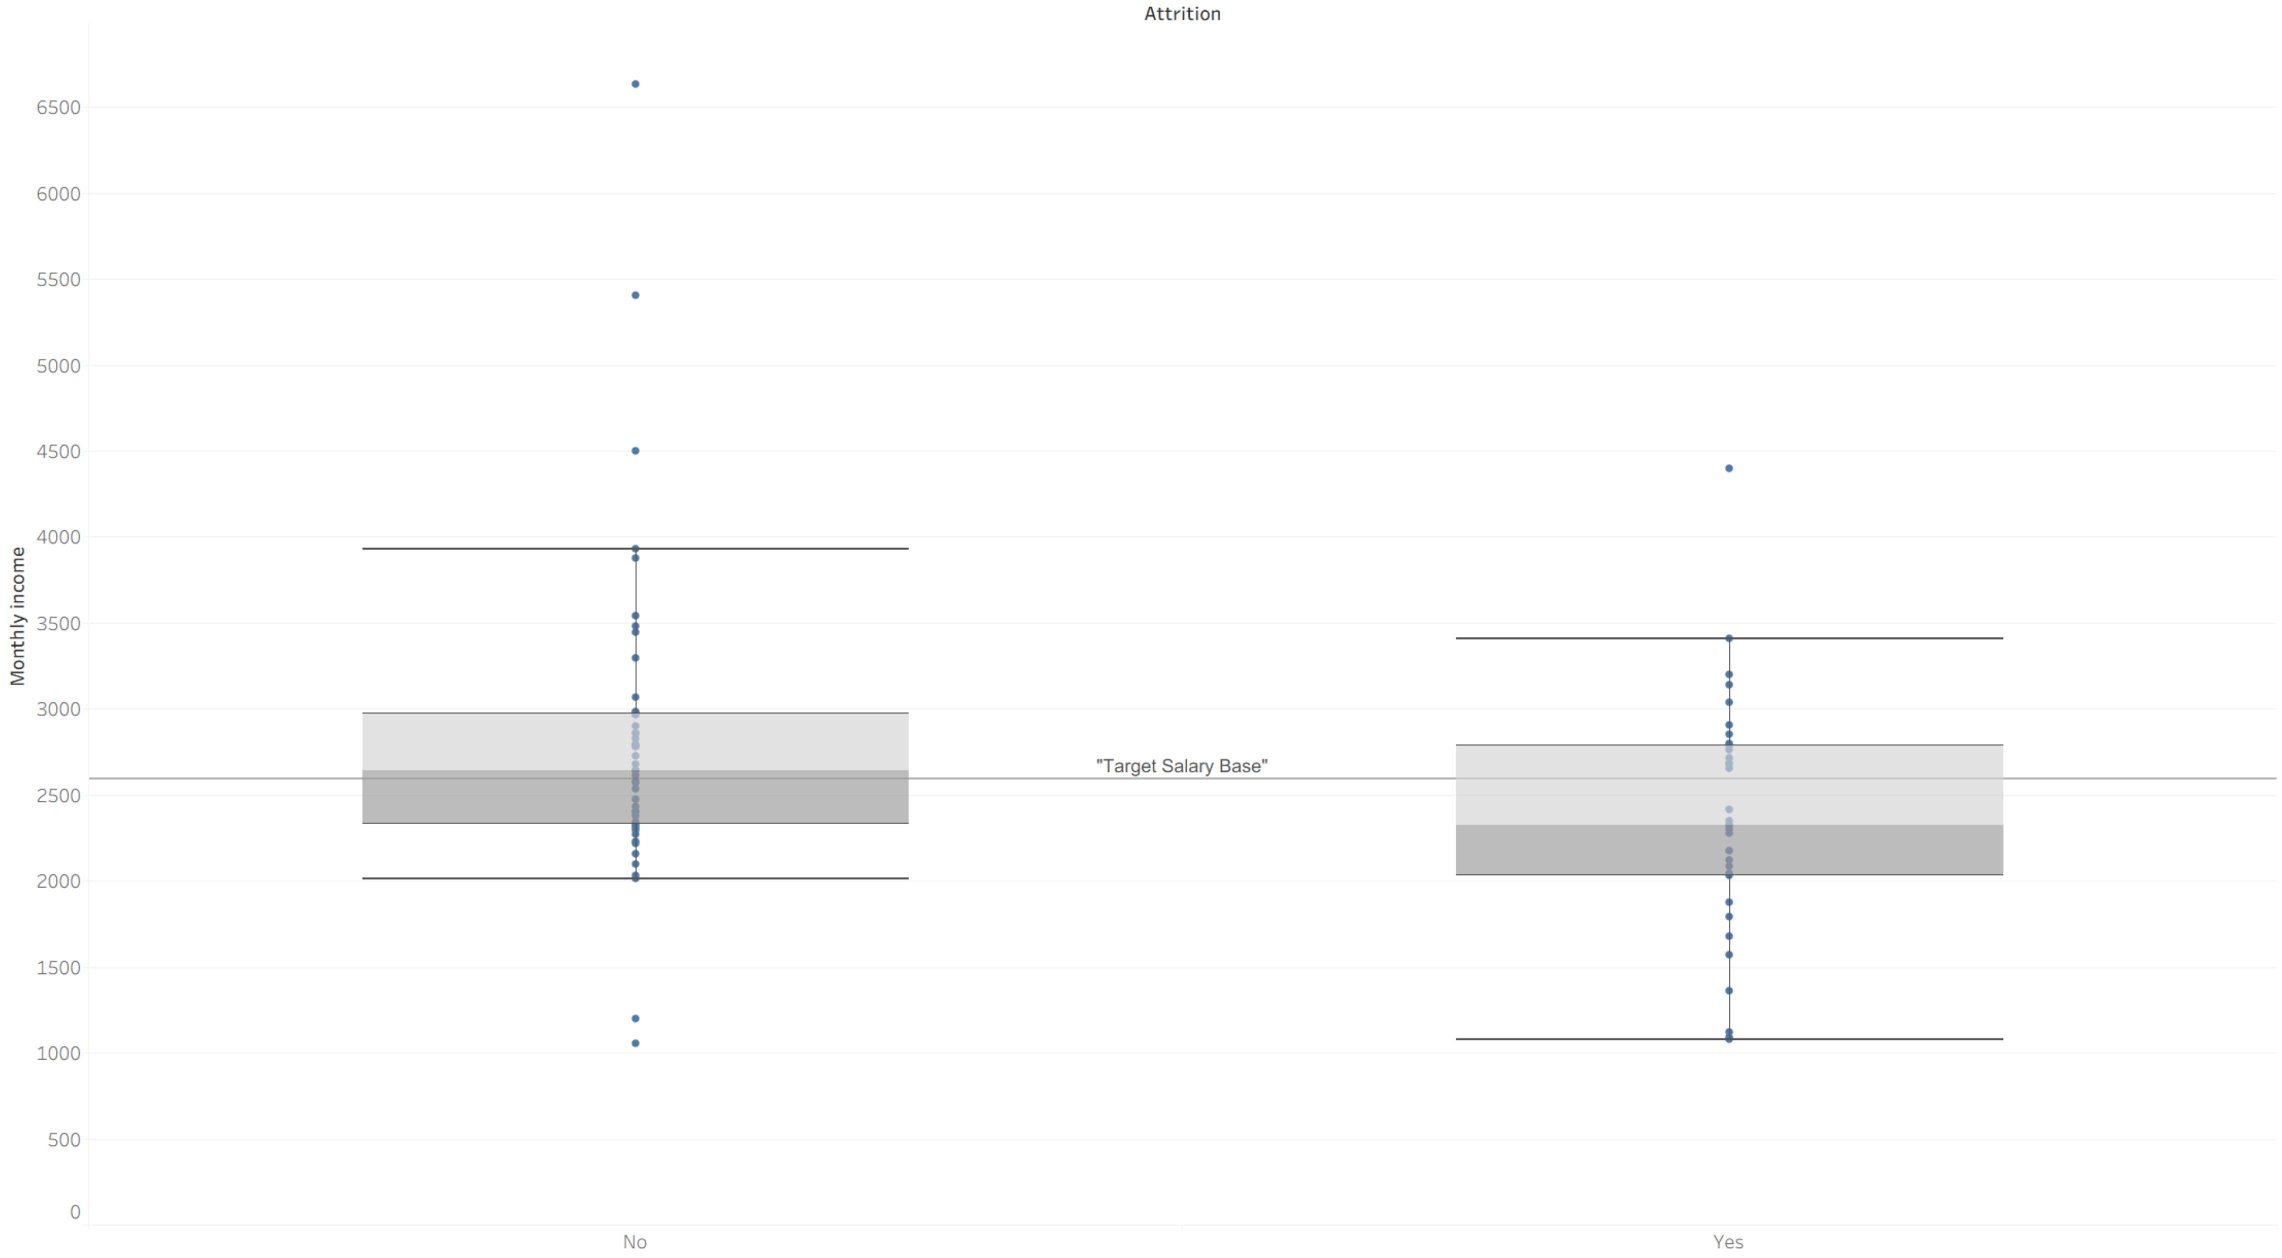
A key resolution is t..

Story

To resolve the identifi..

A key resolution is to benchmark the compensation of current Sales Representatives against the median salary of our retained staff to close the existing pay gap. Implementing a targeted salary adjustment to a base of approximately $2594.5 (as identified in the data) will remove the financial incentive for talent to seek roles elsewhere and stabilize the department.

We have categorized t..



Story

A key resolution i..

We have categorized the workforce into risk tiers based on burnout and satisfaction levels. This resolution map identifies exactly 150 employees in the 'High-Risk' category who require immediate management intervention. By deploying targeted retention bonuses and workload re-balancing to this specific group, the company can proactively stop the 'bleeding' in the most cost-effective way.

FInal Verdict and Referene..

We have categorized the workforce into risk tiers bas..

FInal Verdict and Refereneces

The statistics are a clear picture: the problem of attrition is not accidental, but structural. Following the path of our Context (a stable, mature workforce) to the Tension (localized burnout and pay gaps in Sales) we have ceased to guess why people leave and know precisely where the friction is.

The suggested Resolutions are not merely the nice-to-have HR programs, but they are logical business requirements. By focusing on our high-performing talent and fixing compensation imbalances, we will transition to a reactive culture of replacing people to a proactive culture of retaining value. The current investment in these specific interventions will not only stabilize our operations but will eventually pay off in a huge way in terms of retained institutional knowledge and lowering recruitment expenses.

Solution-1: The decision to prioritize high-performing, dissatisfied employees (as shown in the Resolution Matrix) aligns with Nyberg's (2010) research. Nyberg posits that high performers are more mobile in the labor market; therefore, targeted interventions for this specific group yield a higher Return on Investment (ROI) for the organization

Solution-2: The resolution to adjust salary bands in the Sales department is supported by Gerhart & Fang (2014), who argue that competitive compensation is a fundamental 'hygiene factor' in employee retention. By closing the identified pay gap between leavers and stayers, we mitigate the financial incentive for external job-seeking

Solution-3: The Risk Cluster Treemap utilizes the Job Demands-Resources (JD-R) Theory (Bakker & Demerouti, 2017). By segmenting employees who face high 'demands' (overtime) without sufficient 'resources' (job satisfaction), we identify the demographic most susceptible to burnout and systemic turnover.
